

# **INSTALLATION GUIDE**

CVR-5

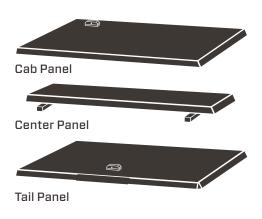

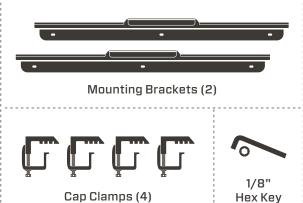

Keep an eye out for these icons:

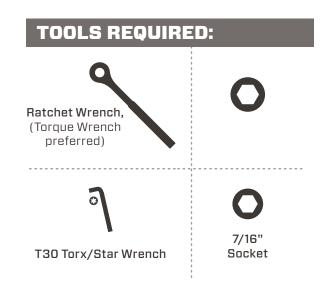

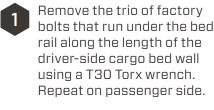

## PRE-INSTALLATION NOTES (REVIEW ALL OTHER INCLUDED INSTALLATION GUIDES BEFORE BEGINNING)

If you're installing a rear window protection accessory, mount it prior to mounting the cover.

Some models require bulkhead preparation first. Please refer to the instructions in the bulkhead prep kit prior to mounting the cover.

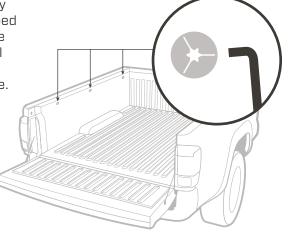

If your cover includes shims, affix the included bed rail shims first and reference their included instructions.

#### PREPARE THE BED

Penetrating oil may be helpful to remove these bolts.

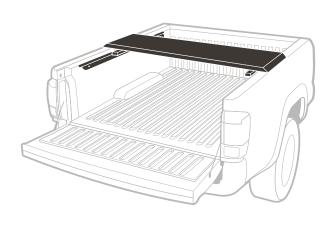

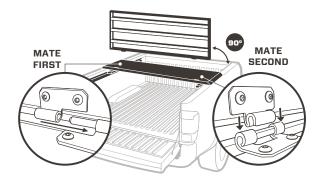

### **MOUNT THE PANELS**

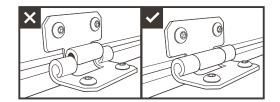

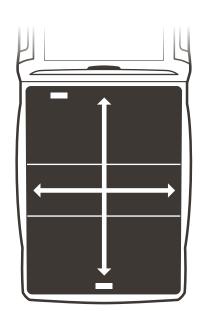

Attach the tail panel by holding it at a 90° angle from the bed rails and mate the driver's side hinge first, followed by the passenger side's c-shaped hinge.

CAUTION! Be sure all hinges are fully mated before lowering panels.

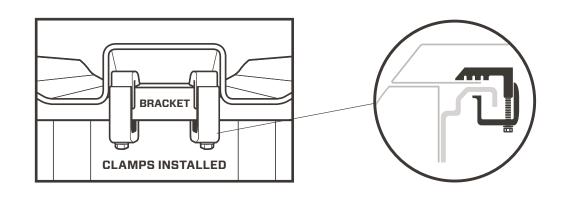

Position the cover front to back so that the front of the cab panel lines up with the outside edge of the center of the bulkhead. Center the cover side-to-side on the truck.

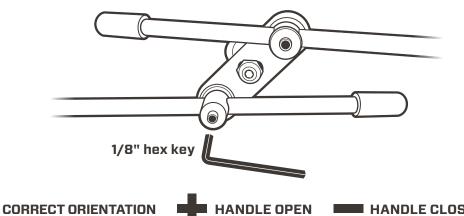

#### POSITIONING CLAMPS

- Position the cap clamps as far apart as possible under the center panel. Attach the center panel by uniformly tightening a cap clamp using a 9/16" socket to between **5-6 ft-lbs**.
  - While tightening clamps, be aware of possible bed rail cap deformation. Overtightening clamps will damage bed rail caps and cause leaking.
  - Retighten after a week of use. Check them every time you haul on top.

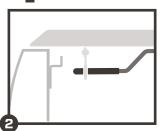

#### **ADJUST THE LOCK RODS**

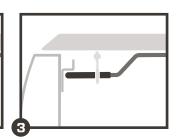

The Z bend orientation

is always maintained

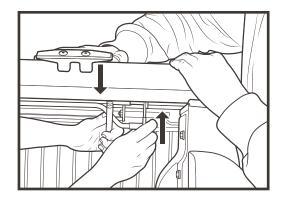

With the lock handle in the open position, the rod tips clear the bracket

With the lock handle in the closed position, be sure the lock rods are fully under the bracket and are engaged as far as possible.

After properly aligning the lock rods in the closed position, it is time to tighten all brackets using a 7/16" socket. To ensure a tight seal, it is crucial to simultaneously push up on the bracket AND apply downward pressure on the cover. Repeat for all bracket locations.

The panels may be tough to open and close at first. Leave the panels closed as much as possible to allow the weatherstrip to break in. After a few days, you'll find things working smoothly.

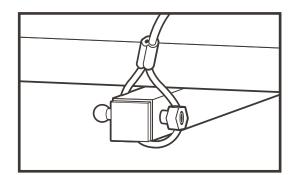

The cab panel has a safety spring lock handle ensuring you engage the lock rods when closing the panel. This helps prevent accidental opening of the panel while driving.

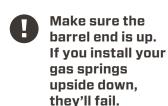

If you are installing a Cross Bin, do so now. Refer to the Cross Bin Installation Guide for details.

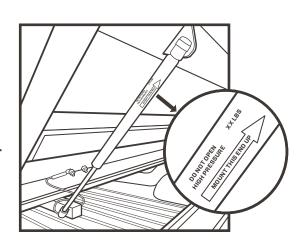

#### **ATTACH THE GAS SPRINGS & SAFETY CATCH**

Open the cab panel. Have a 2nd person support it in the open position. Loop the end of the cable tethers around the ball stud arms, making sure to go beyond the ball stud and nut.

Attach 2 gas springs to the cab panel.

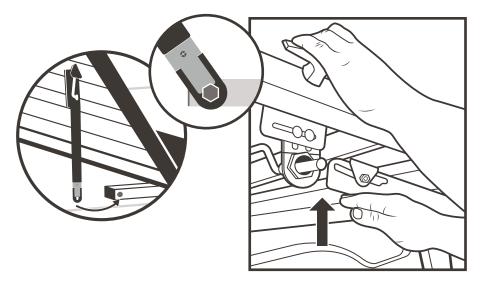

If 2 of your gas springs have heavier poundage printed on them, use them here.

Attach the safety catch by pulling down on the panel and pushing the keyhole at the bottom of the safety catch around the nut, making sure to engage the spring clip.

With the safety catch in place, your cab panel will only open partially. To fully open the panel, pull down on panel while using your other hand to push up on the flat part of the catch until it disengages.

Attach the 2 remaining gas springs on the tail panel, again making sure the barrel end is up.
